EXPERIMENT 5

ROLL NO: 240701020

NAME: ADITYA S

USER INTERFACE DESIGN

Sneaker Shop Mobile Application UI/UX Design Report

1. Introduction

Online shopping allows users to purchase products easily using mobile devices. This project designs a mobile UI prototype for a sneaker shopping application called **Shopzy**. The application allows users to browse sneakers, view product details, add items to the cart, and complete purchases through a checkout system. The design focuses on a simple interface, smooth user experience, and clear navigation. This report explains the wireframes, user flow, interface components, and the working process of the application prototype.

2. Objective of the Project

The objective of this project is to design a simple and efficient mobile sneaker shopping interface. The goals include creating a clean UI, enabling easy product browsing, displaying clear product details, implementing a smooth checkout process, designing a logical user flow using a flowchart, and developing a clickable prototype for demonstration. The system aims to help users complete purchases quickly and easily.

3. Tools Used

Figma

Figma was used to design the wireframes and mobile interface screens. It allows designers to create layouts, components, and interactive prototypes efficiently.

Design Components Used

- Mobile frame layout
- Icons for cart and user profile
- Product images
- Buttons and navigation elements
- Input fields for search functionality

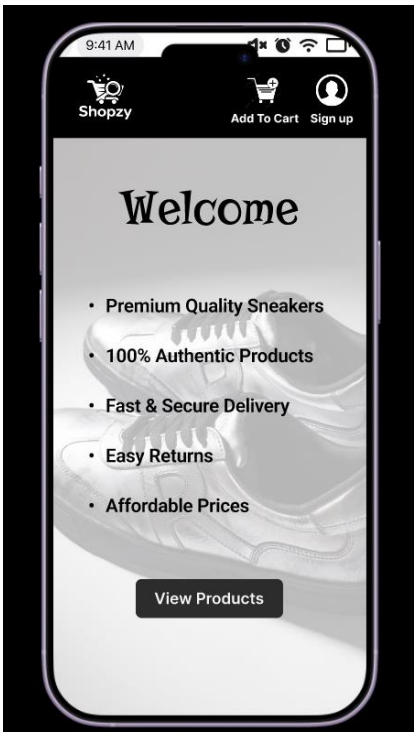
LUCID CHART

For designing flowchart for the designed wireframes in the mobile frames.

4. Wireframe Design

Wireframes represent the **basic layout and structure of the application screens**. They help visualize the placement of UI elements before the final design is developed.

Home Screen

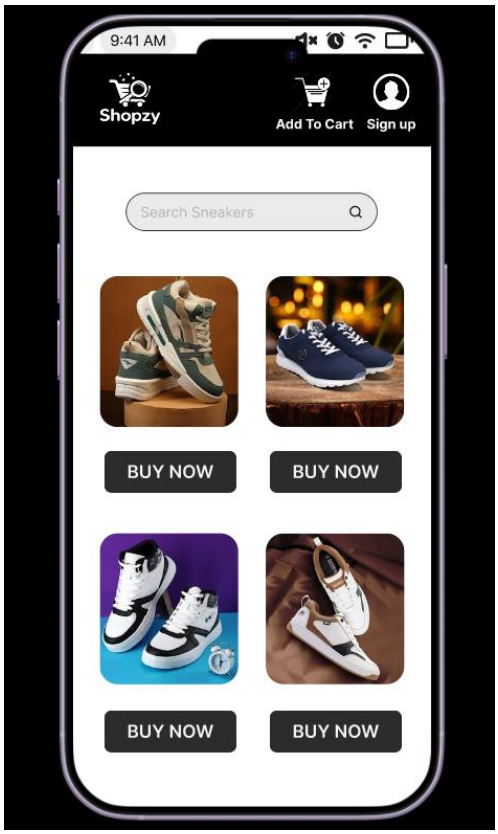


The home screen welcomes the user and introduces the platform. It includes:

- Shopzy brand logo
- Cart and user account icons
- Welcome message
- Key features of the store
- Button to view products

The home screen provides a **first impression of the application and guides users to explore products**.

Product Listing Screen



The product listing page allows users to browse available sneakers.

Features of this screen include:

- Search bar to search sneakers
- Product image cards
- "Buy Now" buttons
- Grid layout for easy browsing

This screen helps users quickly **explore different sneakers and choose a product** they are interested in.

Product Details Screen

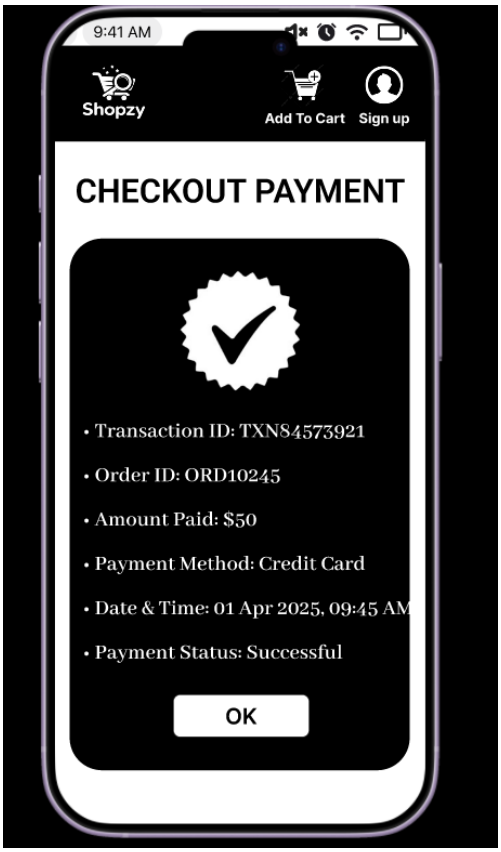
After selecting a product, users are taken to the product details screen.

This screen contains:

- Product information
- Key product features
- Price of the sneaker
- Add to cart button

The purpose of this page is to give users **complete information about the product before purchasing**.

Checkout Payment Screen



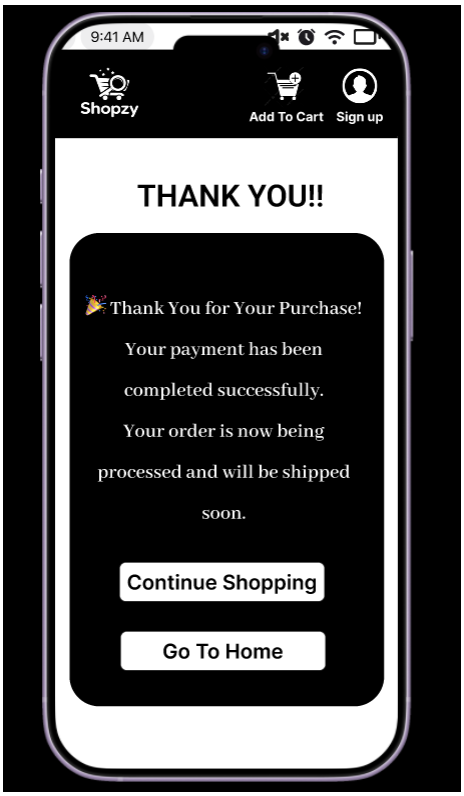
The checkout screen displays payment confirmation after the purchase process.

It includes:

- Transaction ID
- Order ID
- Amount paid
- Payment method
- Date and time of transaction
- Payment status

This screen confirms that the **payment has been successfully processed**.

Thank You Screen



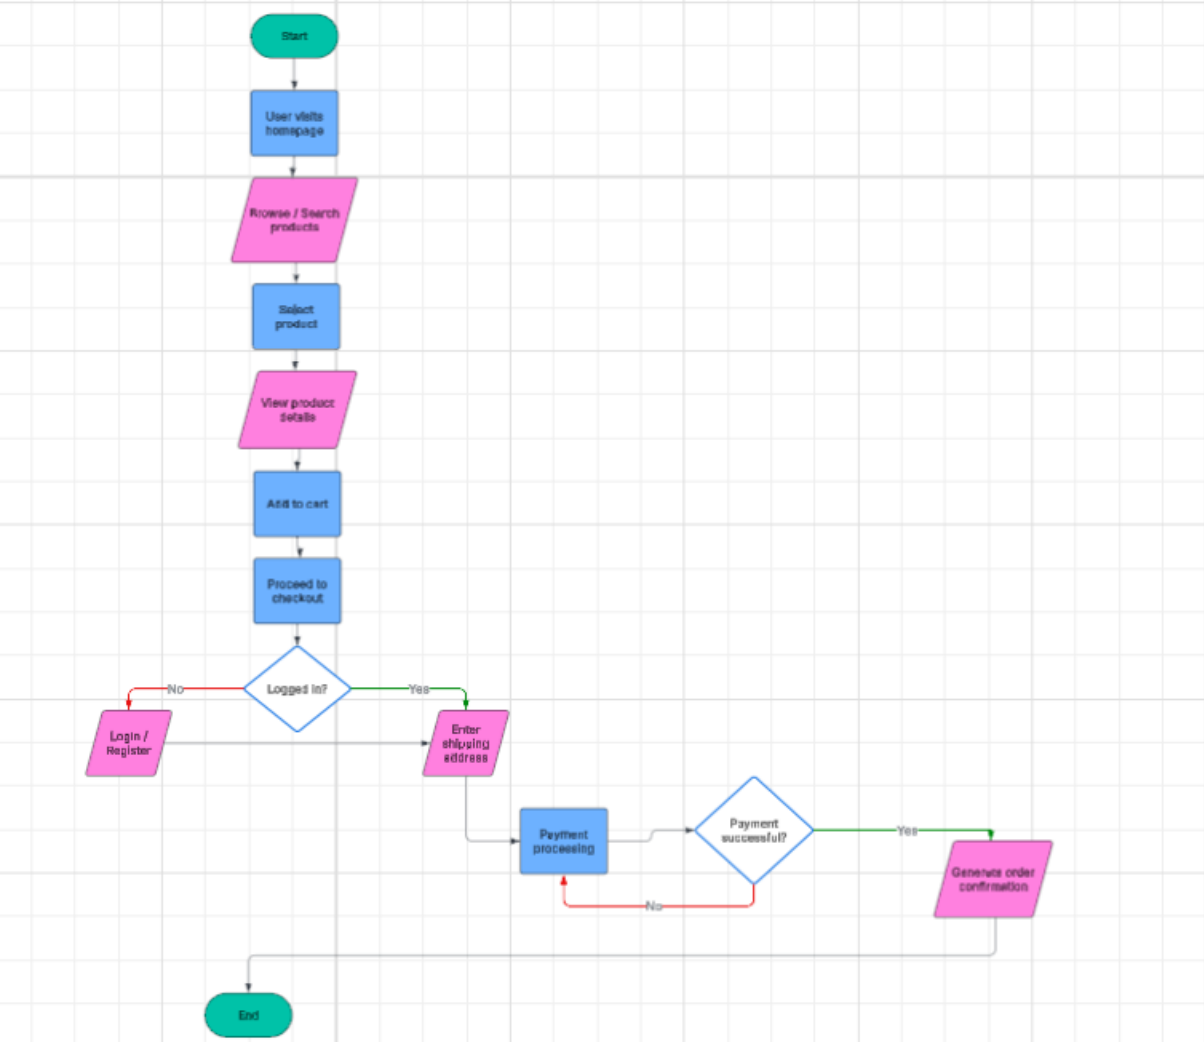
The final screen thanks the customer for completing their purchase.

This page includes:

- Thank you message
- Confirmation that payment was successful
- Notification that the order is being processed
- Buttons for continuing shopping or returning to the home page

This screen provides **closure to the shopping process and enhances user satisfaction**.

5. User Flow



User flow describes the **step-by-step journey of a user within the application**.

The typical user journey follows these steps:

1. The user opens the application.
2. The user lands on the homepage.
3. The user browses or searches for sneakers.
4. The user selects a sneaker product.
5. The product details page displays information about the product.
6. The user adds the product to the cart.
7. The user proceeds to checkout.
8. The system checks whether the user is logged in.
9. If the user is not logged in, they must login or register.
10. The user enters the shipping address.
11. The user completes the payment process.
12. The system verifies whether the payment is successful.
13. If the payment fails, the system returns to the payment process.
14. If the payment succeeds, the system generates an order confirmation.

15. The user sees the thank you page.

This flow ensures that users can **complete the purchase in a clear and structured manner**.

6. Flowchart Explanation

The flowchart visually represents how users interact with the system.

The process starts when the **user visits the homepage** of the sneaker shopping application.

The user can browse or search for sneakers and then select a product they are interested in. After selecting the product, the system displays detailed product information.

Once the user decides to purchase the product, they add it to the cart and proceed to checkout.

At the checkout stage, the system verifies whether the user is logged in. If the user is not logged in, they must login or register before continuing.

After authentication, the user enters their shipping address and moves to the payment stage. The payment system processes the transaction and checks whether the payment was successful.

If the payment fails, the user is returned to the payment process to try again. If the payment succeeds, the system generates the order confirmation and displays the final thank you page.

This flowchart ensures that the system handles **both successful and unsuccessful payment scenarios**.

7. Features of the Application

The sneaker shopping application prototype includes several key features.

Simple Navigation

The application provides clear navigation through icons and buttons, allowing users to easily move between pages.

Product Search

Users can search for sneakers using a search bar, helping them quickly find the products they want.

Product Information

Each product displays important details such as material quality, comfort, durability, and price.

Secure Checkout

The checkout system provides a structured payment process and displays transaction details for confirmation.

User Feedback

The final thank you screen confirms that the purchase has been completed successfully.

8. Conclusion

This project demonstrates the design of a mobile sneaker shopping application using wireframes and prototypes. The application focuses on providing a simple and efficient user experience for browsing and purchasing sneakers.

The user interface was designed with clear navigation, organized product display, and a structured checkout process. The flowchart ensures that the user journey is logical and easy to follow.

Overall, the prototype successfully demonstrates how users can interact with an e-commerce platform through a mobile interface.

Future improvements may include features such as:

- Product filtering
- User reviews
- Wishlist functionality
- Order tracking

These enhancements would further improve the user experience and functionality of the application.
